

# A Software Development and Validation Framework for SDR Platforms

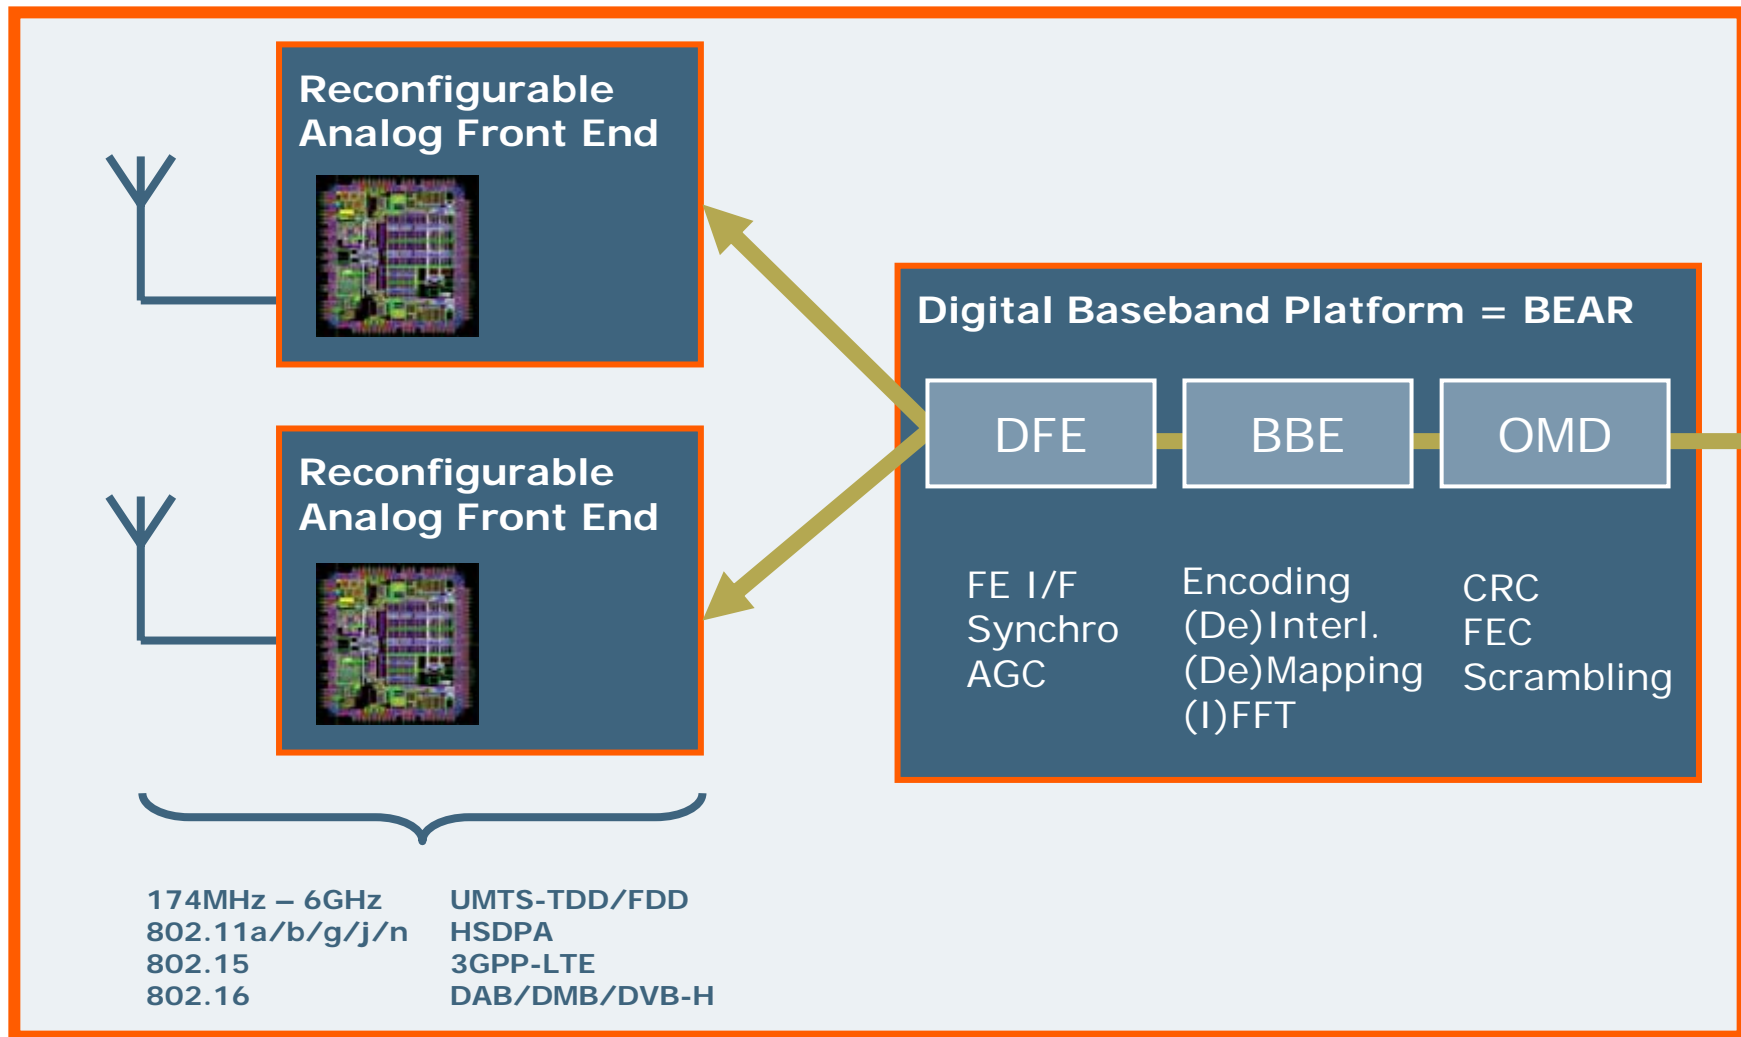

Jeroen.Declerck@imec.be

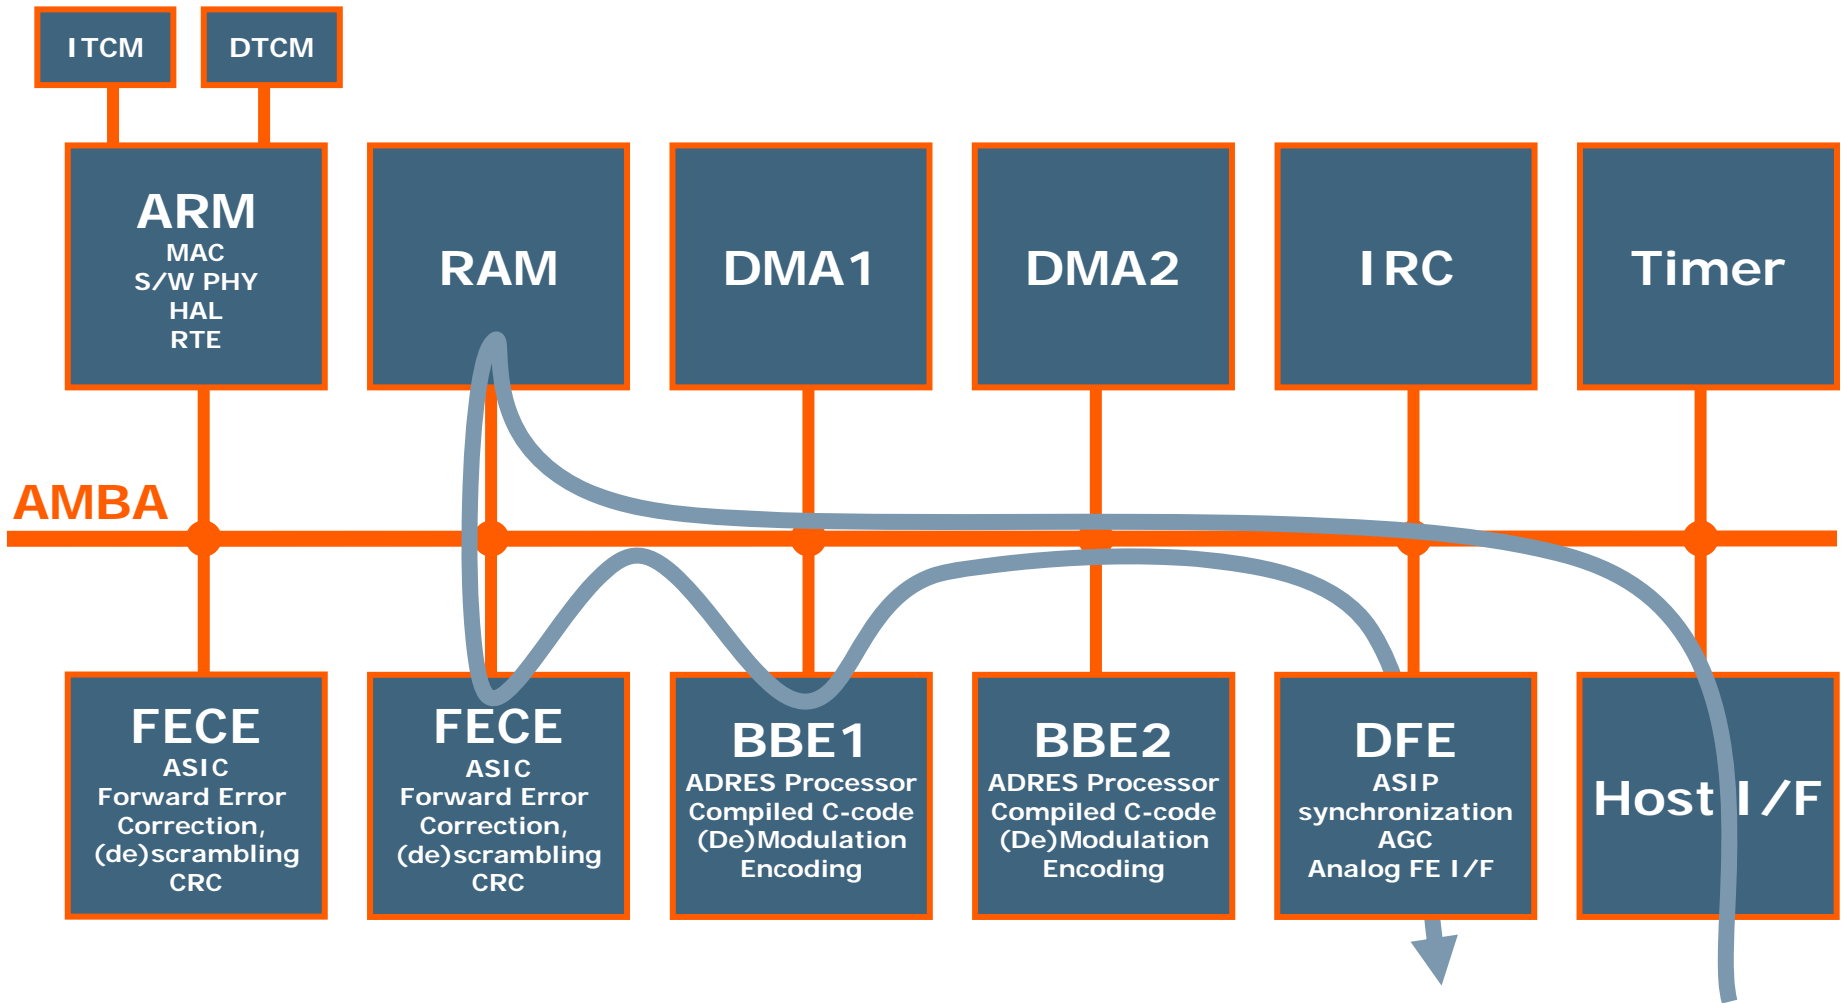

# Outline

- IMEC SDR Platform
- Problem Statement
- Framework (XMSF) Implementation
  - XMSS server
  - Graphical logger
  - IMEC SDR
  - TCP/IP connection
- Framework (XMSF) Simulation Results
  - 802.11a PHY
  - 802.11 MAC
  - Platform Exploration
- Conclusion

# IMEC SDR Platform: Functional View

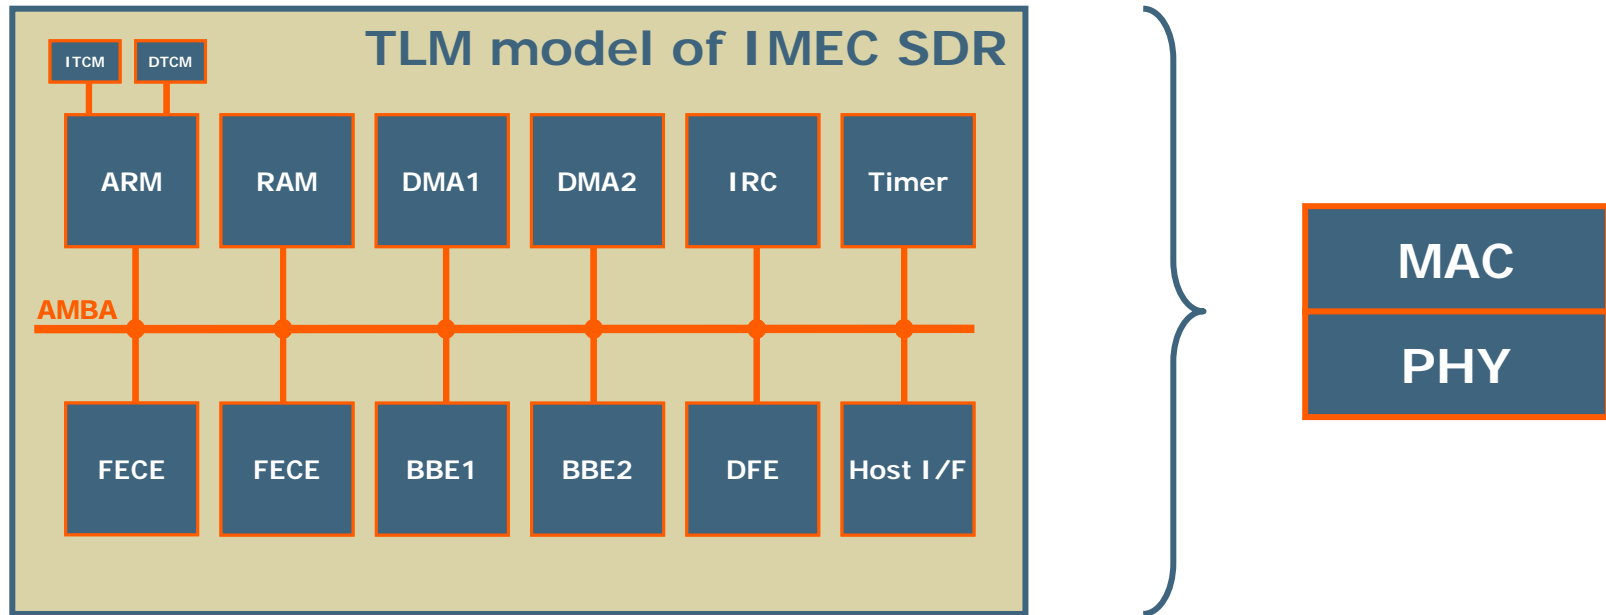

# IMEC SDR Platform: BEAR Chip

# Problem Statement: Intention

- Simulation of native PHY/MAC software code on a specific SDR platform (IMEC SDR)
- Visualize the impact on the hardware components (DMA, timer, BBE, DFE, OMD...)
- Existing solution (see next): TLM

# Problem Statement: TLM

- Byte accurate
- Bus simulations
- Sw/Hw cosimulations
- Full Hw validation
- Runs native code

- No channel
- No multiple terminals
- No TCP/IP
- No full MAC/PHY s/w validation possible
- 2 minutes simulation / packet

# Problem Statement: Requirements

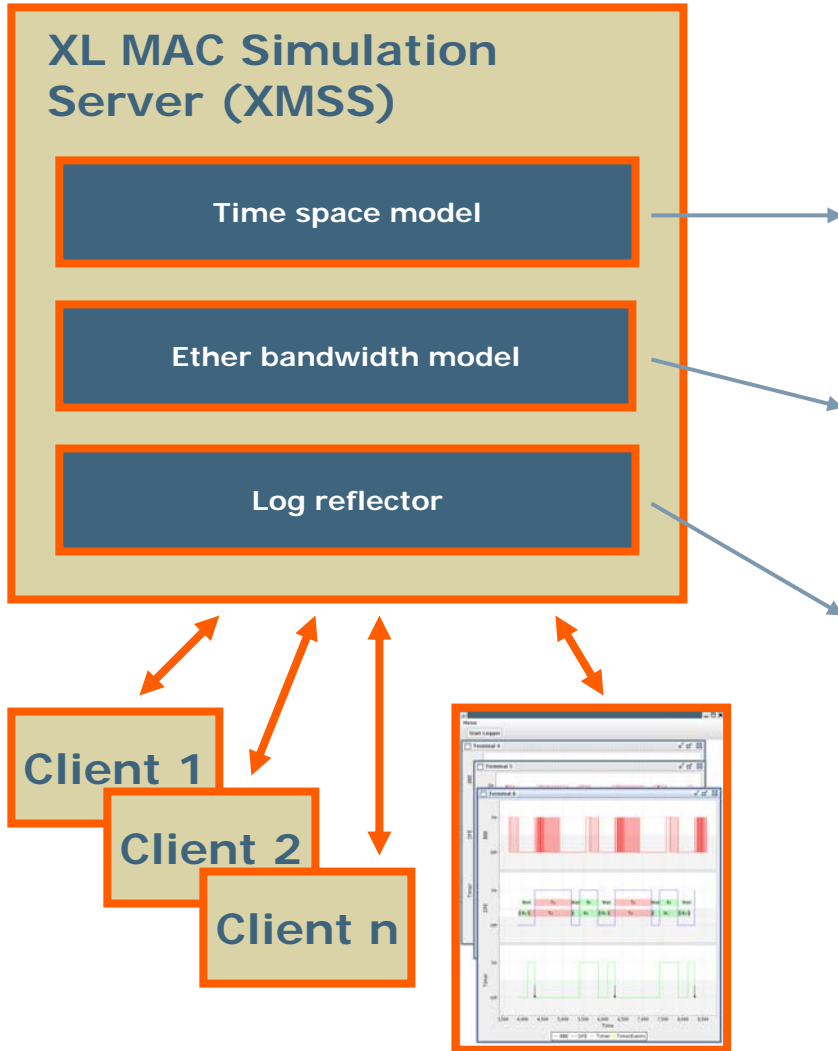

- Development/ Simulation/ Validation platform for system code (SDR PHY/MAC control software)
- Multiple terminals connected together
- Simulate native compiled PHY/MAC code
- Fast enough for network simulations

**XMSF**

(cross layer –XL- MAC Simulation Framework)

# XMSF: XMSS

**XMSS: Server process that accepts connections from clients**

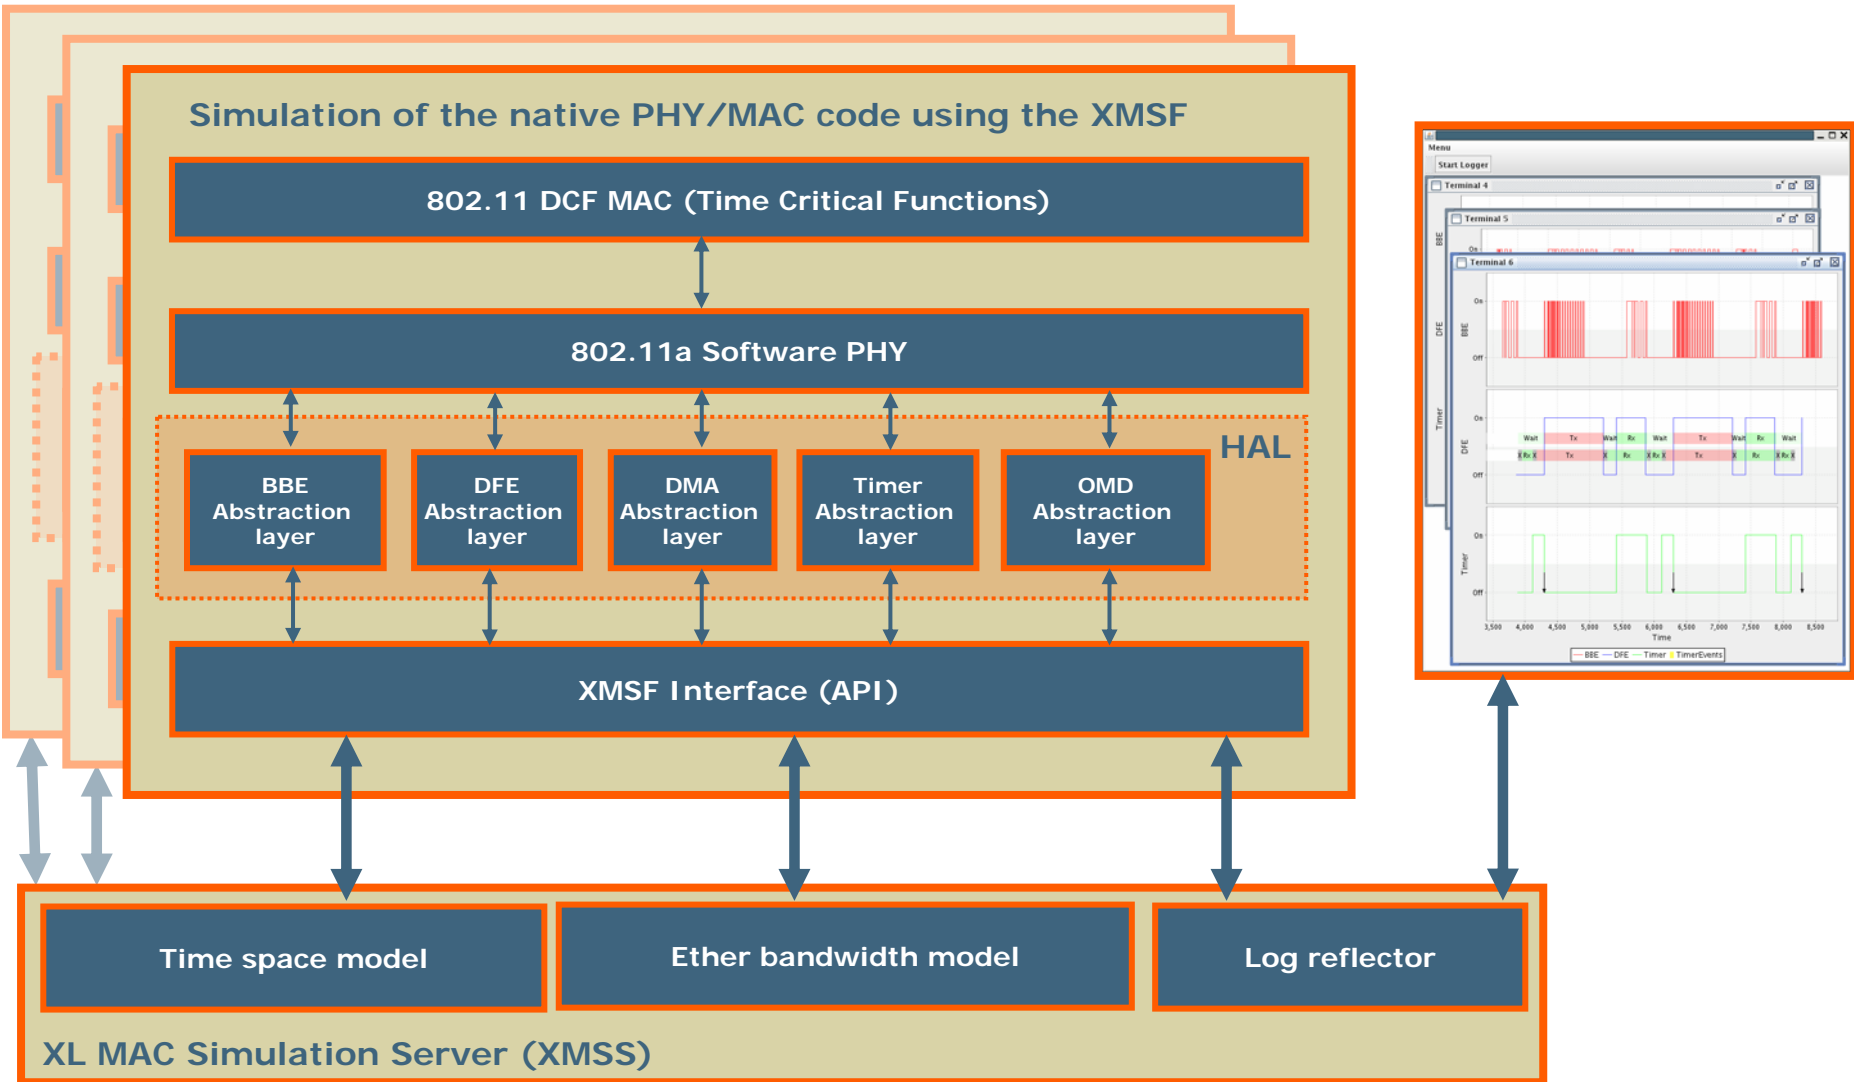

- Add Events to a global timeline
- Callback when event elapses

- Perfect Air Interface Model
- Add complex channel models through dll libraries

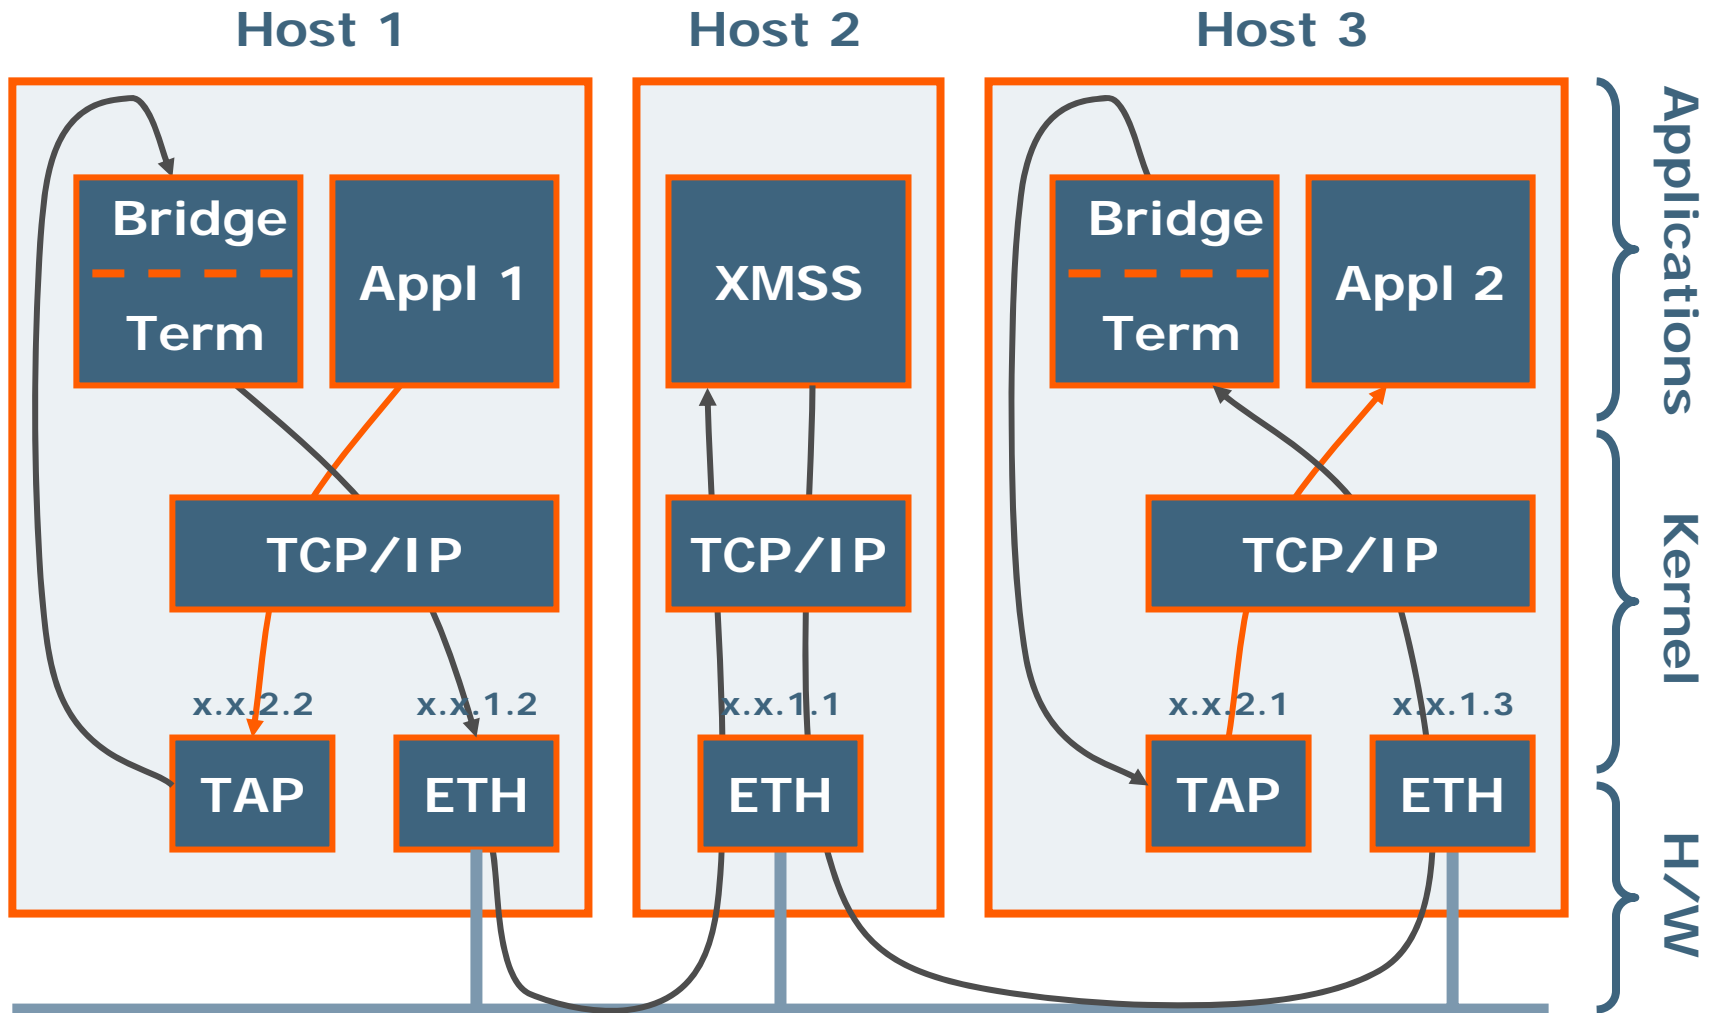

- Centralized logging point
- Graphical analyzer using logs

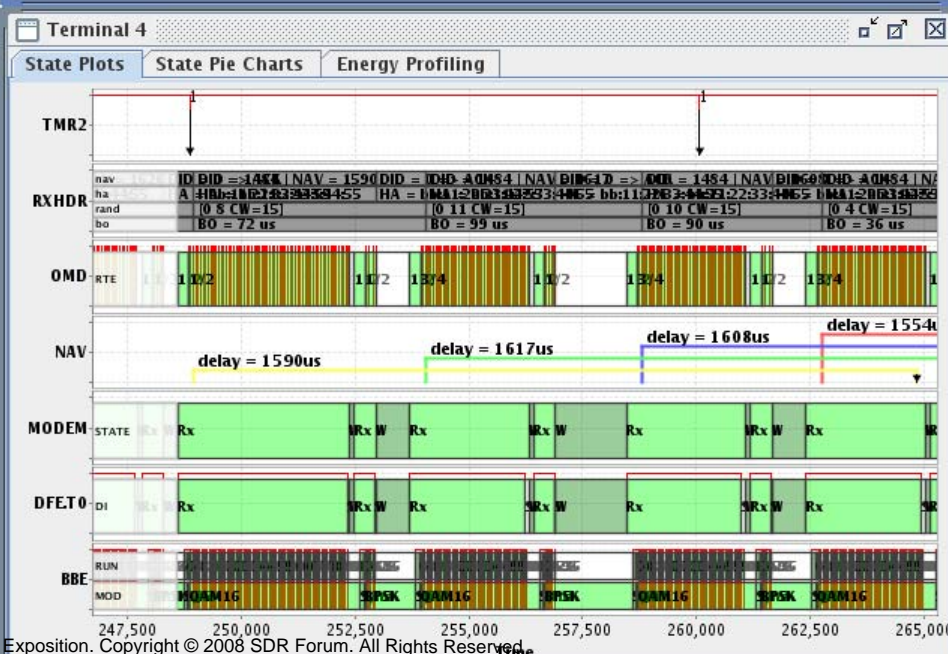

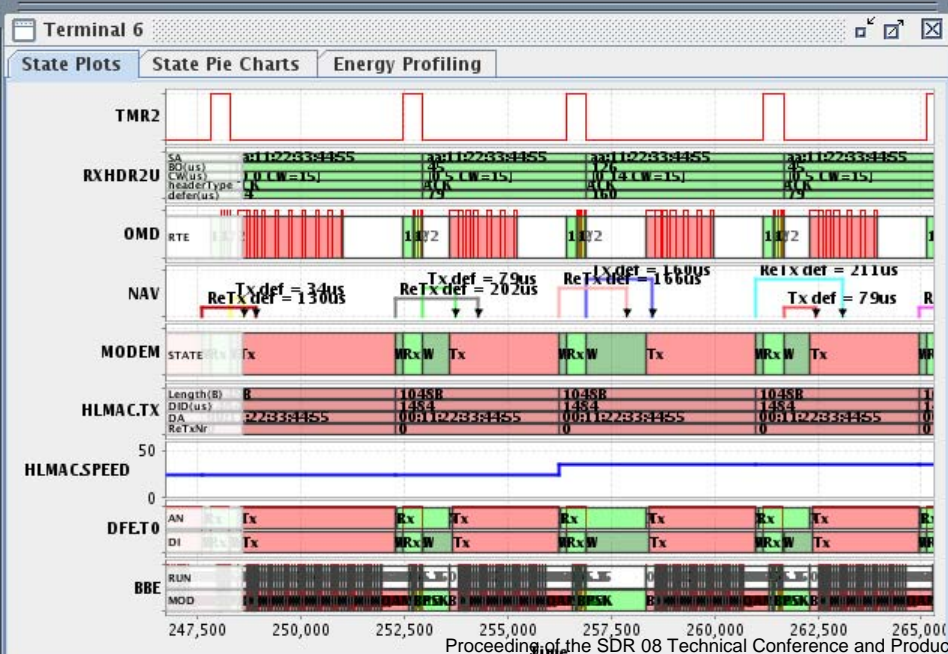

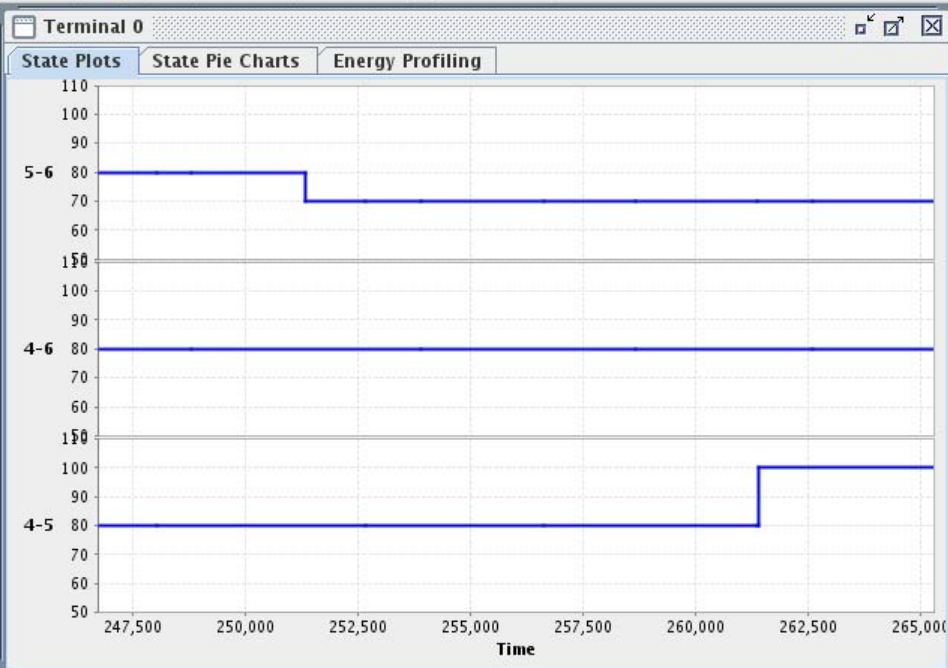

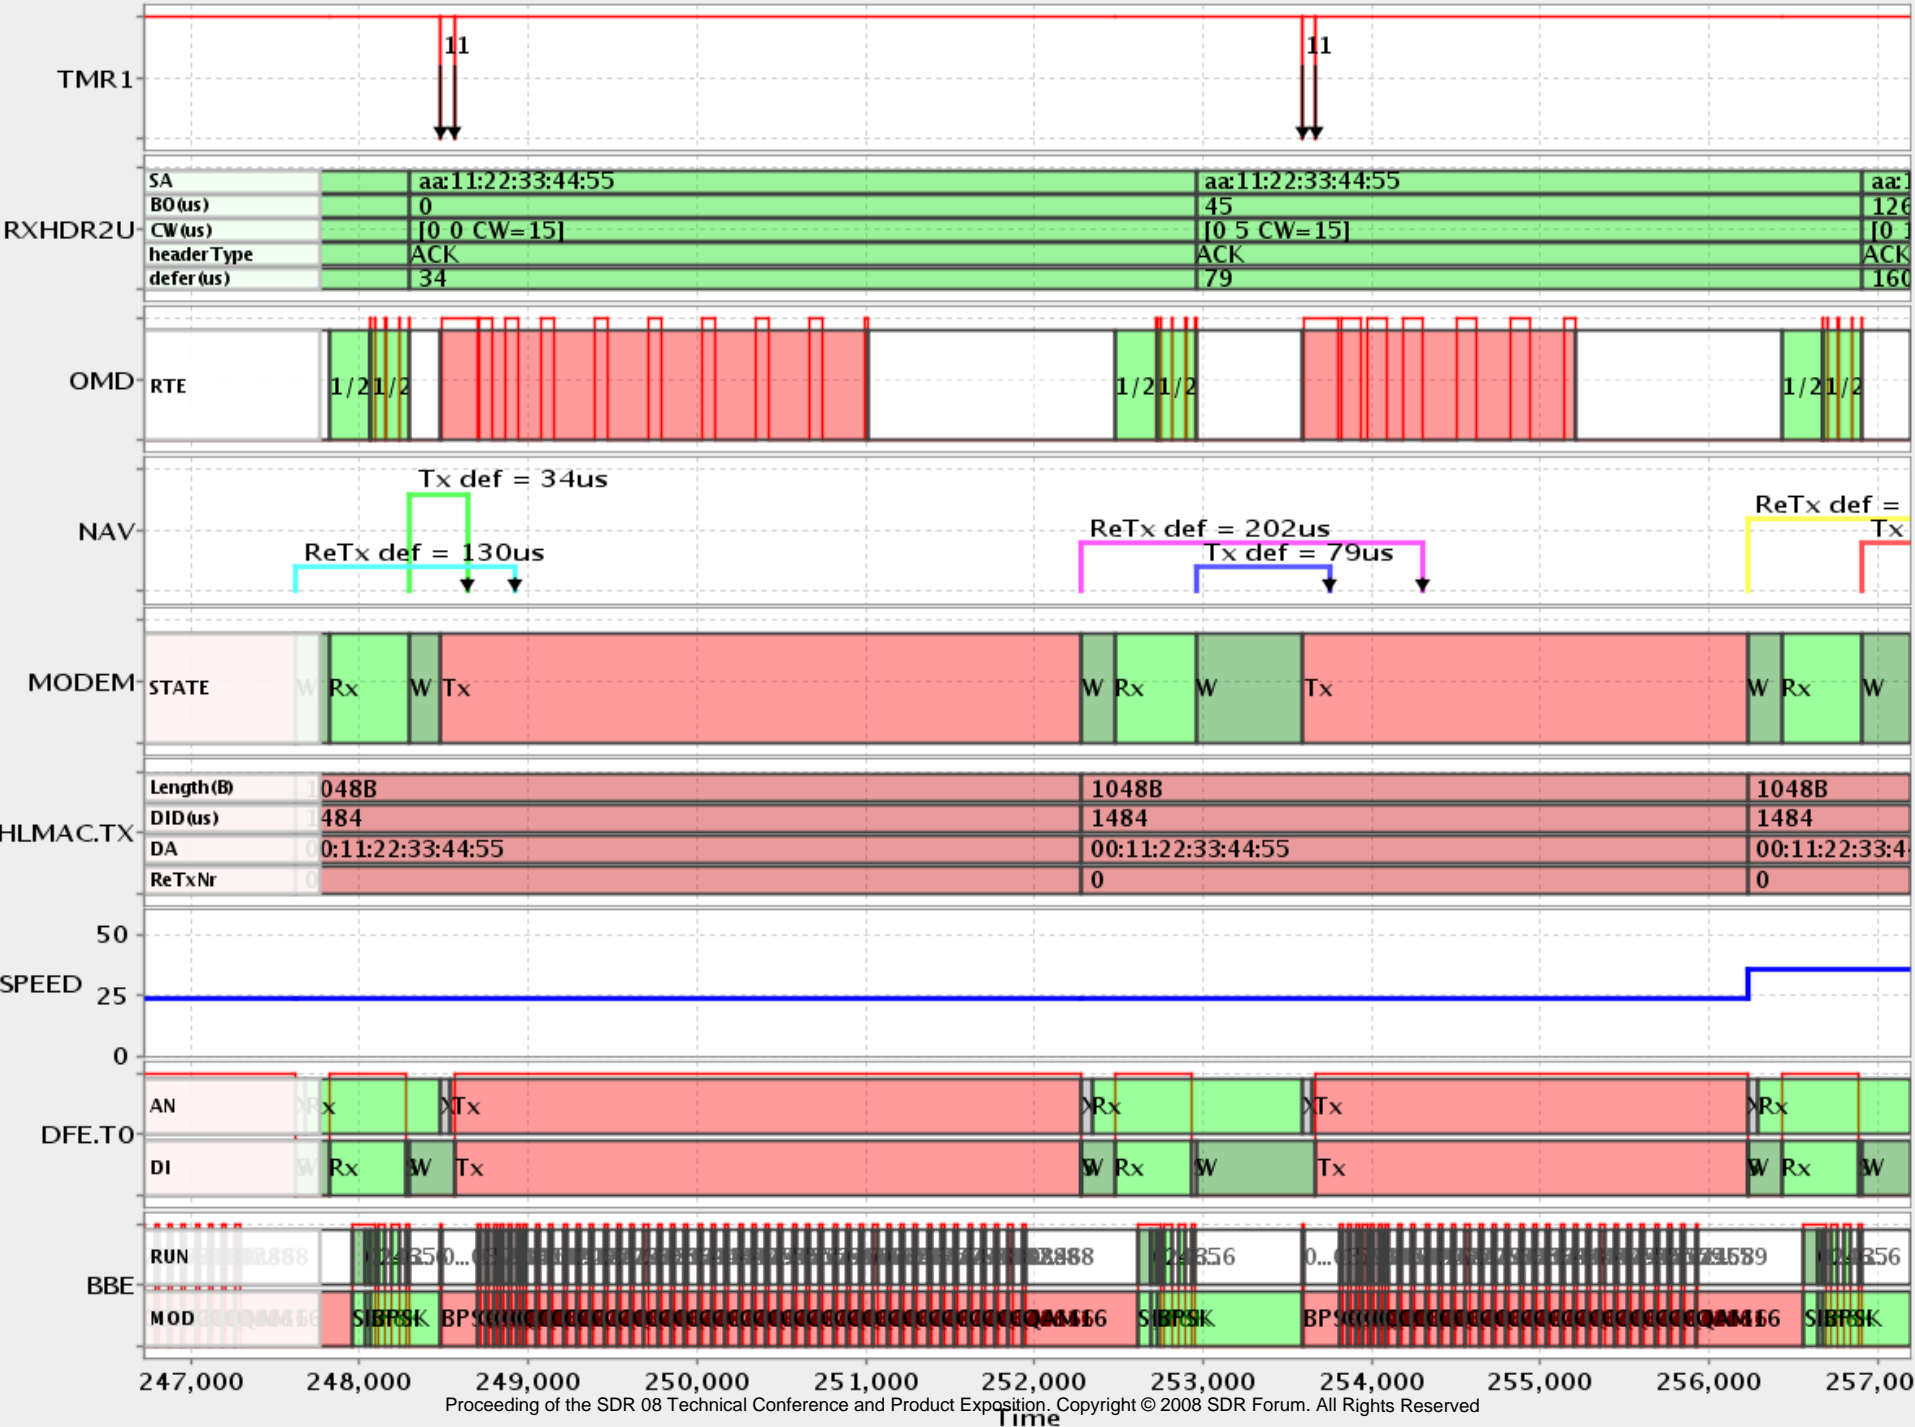

# XMSF: Implementation of PHY/MAC

# XMSF: Integration with TCP/IP

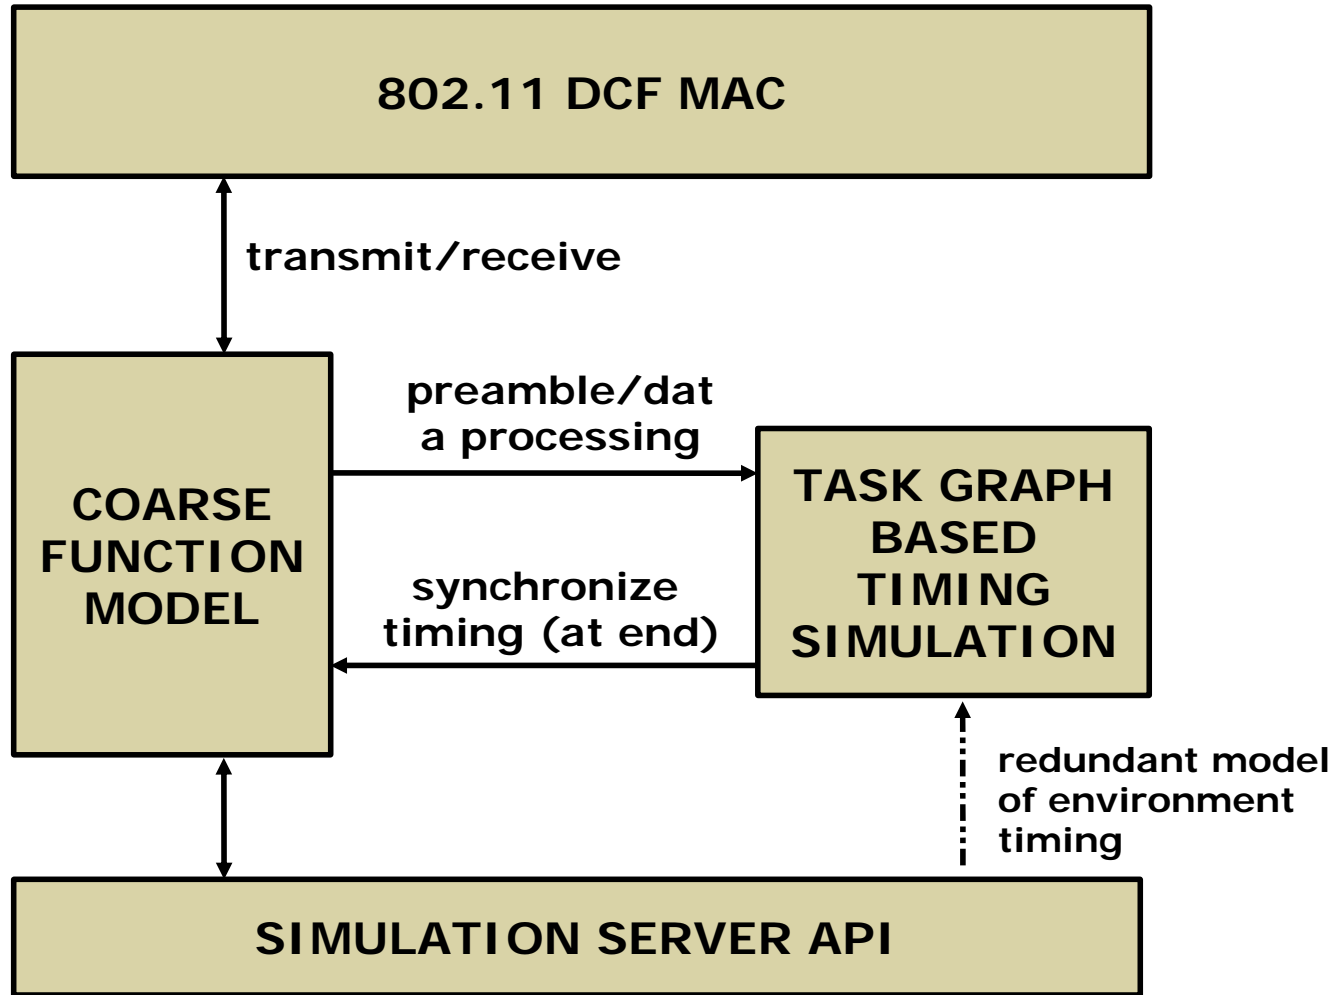

# XMSF Simulation Results: Energy Profiling

# XMSF Simulation Results: Platform Exploration

# XMSF: Other Features

- Coupling between CoWare ConvergenSC tools (SystemC/VHDL co-simulator), the XMSS server and graphical analyzer.
- Synchronize the XMSS server with the Spooks streaming video server

# Future Work

- GUI for channel model
- 802.11n (MIMO) PHY
- 3GPP-LTE PHY/MAC
- Handover
- Scheduler for multiple streams on SDR
